

*For adults with nasal polyps who have  
had previous ethmoid sinus surgery*

*Innovation that helps  
you breathe easier*

**INDICATION**

SINUVA Sinus Implant is a steroid-releasing (mometasone furoate) implant indicated for the treatment of nasal polyps, in patients  $\geq 18$  years of age who have had ethmoid sinus surgery.

**Please see accompanying Full Prescribing Information for Important Safety Information about SINUVA.**

**SINUVA**<sup>®</sup>  
(mometasone furoate) sinus implant

# If you're suffering from nasal polyps, you are not alone.

Studies, including a survey by the National Center for Health Statistics, have shown that up to 10% of all Americans suffer from chronic sinusitis, with or without nasal polyps.

Symptoms of this condition include nasal discharge, loss of smell, facial pain, and persistent nasal obstruction, which can make it difficult to breathe. Symptoms are often treated with **intranasal steroid sprays, saline rinses, and oral steroids.**

To help address significant cases of chronic sinusitis, more than 500,000 endoscopic sinus surgeries (ESS) are performed in the United States annually.

***“More than 500,000 endoscopic sinus surgeries are performed in the US annually.”***

**Unfortunately, these procedures may not prevent symptom recurrence.**

About 60% of all people who had ESS will return to their doctors with symptoms of chronic sinusitis within a year.

And **one in four will return for surgery** at some point, many of them within a year of the first procedure.

The recurrence of nasal polyps after sinus surgery necessitates additional therapy options that can help patients.

**There's another option.  
The SINUVA™ Sinus Implant.**

SINUVA was designed to treat nasal polyps and is an alternative to surgery and other treatment options **for adults who have already had ethmoid sinus surgery.**

**Please see accompanying Full Prescribing Information for Important Safety Information about SINUVA.**

**SINUVA**<sup>®</sup>  
(mometasone furoate) sinus implant

# What is SINUVA?

The SINUVA Sinus Implant is an innovative technology that reduces polyps and the sensation of nasal congestion and obstruction with a 2-in-1 approach:

## 2-in-1

Designed to open in the sinus cavity

Delivers anti-inflammatory medicine to treat nasal polyps

- SINUVA is delivered into the sinus cavity through the nasal opening during a routine office visit
- A doctor will use topical and/or local anesthesia to numb your nose and sinuses
- SINUVA usually cannot be felt once it's in place
- SINUVA will be removed at 90 days or earlier at your doctor's discretion

## Did you know your nasal spray has a hard time reaching your sinuses?

Because of nasal polyp obstruction, the medicine in the spray doesn't always reach its target. That's why one of the benefits of SINUVA is that it reduces the blockage in the nasal passage which may allow the spray to reach the area where it's needed most.

*According to Kern et al, 2017: IFAR.*

Ask your doctor if SINUVA is right for you.

# How well does SINUVA work?

SINUVA is proven to shrink nasal polyps and reduce nasal obstruction and congestion. As it stays in the sinus and continues to release medicine, SINUVA offers sustained symptom relief for up to 90 days.

**In addition, SINUVA is proven to significantly reduce sinus obstruction, improve a patient's sense of smell, and reduce their need for surgery.**

SINUVA was studied in a clinical trial with 201 patients who received SINUVA and 99 patients who underwent a procedure as a placebo. All patients in the study were diagnosed with chronic sinusitis who had already undergone sinus surgery, but were candidates for revision surgery. Whether they received SINUVA or not, all patients were required to use a nasal spray daily that contained steroids.

**Please see accompanying Full Prescribing Information for Important Safety Information about SINUVA.**

**SINUVA**<sup>®</sup>  
(mometasone furoate) sinus implant

# Is SINUVA safe?

Because SINUVA is placed directly amongst the nasal polyps, it's able to provide sustained symptom relief with a low rate of side effects.

## The safety of SINUVA was established in 400 patients in 2 clinical trials

- The most common side effects were asthma, headache, and nose bleed. This is how the patients who received SINUVA compared to those in the control group:

	Asthma	Headache	Nose Bleed
Control	4.1%	3.4%	1.4%
SINUVA	4.7%	3.5%	2.4%

See the accompanying Full Prescribing Information for a complete list of side effects reported in the clinical trial and since SINUVA's approval.

## As with all endoscopic sinus procedures, there are risks associated with the insertion and removal of the SINUVA Sinus Implant.

- The risks from SINUVA are similar to those associated with other endoscopic sinus procedures, such as nose bleed, injuries to blood vessels, and bacterial infection
  - SINUVA has not been studied in people with cystic fibrosis, acute bacterial infections, or invasive fungal sinusitis
  - SINUVA is not for people with hypersensitivity to corticosteroids or those with nasal ulcers or trauma

## Contact a doctor immediately if you experience:

- Excessive nasal bleeding or symptoms of infection, such as excessive pain or discomfort, persistent headache, or increased sinus discharge
- Symptoms suggesting that the implant has moved, such as irritation or a choking sensation in the back of the throat

Hypersensitivity reactions, including rashes, itching, and hives, have been reported with use of the medicine in SINUVA. Remove the SINUVA sinus implant if such reactions occur.

Close monitoring is recommended for patients with a change of vision or a history of increased intraocular pressure, glaucoma, and/or cataracts.

Please see accompanying Full Prescribing Information for Important Safety Information about SINUVA.

**SINUVA**<sup>®</sup>

# Frequently Asked Questions

## How do I get SINUVA?

SINUVA is prescribed and placed by your doctor if appropriate. Ask your doctor if SINUVA is right for you.

## How is SINUVA implanted in my sinus cavity?

SINUVA is placed in your doctor's office, using local anesthesia. After numbing your nose, your doctor will introduce the SINUVA implant into your nostril on the end of a Delivery System, and place the implant within your sinus.

## How long does the SINUVA procedure take?

In SINUVA clinical studies, the typical procedure took 30-40 minutes. This includes 10-30 minutes to numb your nose and ~5-10 minutes to place the SINUVA Implants.

## How does SINUVA work to reduce nasal polyps?

SINUVA is implanted in your sinus cavity next to the nasal polyps to provide local delivery of a drug called mometasone furoate (a type of steroid). The Implant has been shown to be effective in reducing nasal obstruction and congestion, and shrinking polyps.

## How much medicine is in each implant?

Each SINUVA Sinus Implant contains 1350 mcg of mometasone furoate.

## Should I continue to use saline irrigations or nasal sprays after the SINUVA procedure?

Yes, you are encouraged to use both saline irrigations and nasal sprays as needed.

## What happens to the implant while it's in my body?

The implant is designed to release medicine over the course of 90 days. The implant gradually softens over time while it is in your sinus.

## Will the implant be removed by a doctor?

SINUVA is designed to deliver the drug over the course of 90 days and will be removed at that time or earlier at your doctor's discretion.

## Can I sneeze out the implant?

As the implant softens and polyps decrease, the implant may, in part or in whole, be expelled out of the nose on its own or with actions such as sneezing or forceful nose-blowing.

## Is SINUVA covered by insurance?

Many insurance policies will cover SINUVA. It is important to check with your insurance provider to ensure that your treatment plan is covered under their policy.

**Please see accompanying Full Prescribing Information for Important Safety Information about SINUVA.**

**SINUVA**<sup>®</sup>  
(mometasone furoate) sinus implant

## INDICATION

SINUVA Sinus Implant is a prescription steroid-releasing (mometasone furoate) implant indicated for the treatment of nasal polyps in patients 18 years or older who have had ethmoid sinus surgery.

## IMPORTANT SAFETY INFORMATION

### Who should not use SINUVA?

Do not use SINUVA if you are allergic to mometasone furoate or any ingredients of the implant.

### What should I tell my doctor before receiving SINUVA?

Before you receive SINUVA, tell your doctor about all medical conditions you have including nasal/sinus problems (such as nasal ulcers or trauma), eye problems (such as glaucoma or cataracts), or any untreated fungal, bacterial, or viral infections.

### What are the possible side effects of SINUVA?

#### Serious side effects of SINUVA can include:

- **Local reactions** including nosebleed and injury to nerves or blood vessels in the nose/sinus.
- **Serious allergic reactions** have happened in patients using mometasone furoate including rash, itching or swelling of the lips, face, tongue, and throat, and breathing problems. Call your doctor right away if you have any of these reactions.
- **Weakened immune system** that may increase your risk of infections. Avoid contact with people who have contagious diseases such as chickenpox or measles. Call your doctor right away if you have been near someone with chickenpox or measles.
- **Adrenal insufficiency** is a condition in which the adrenal glands do not make enough steroid hormones and can cause tiredness, weakness, nausea and vomiting and low blood pressure. Talk to your doctor if steroid effects such as Cushing Syndrome and adrenal suppression appear.

**The most common side effects** of SINUVA in clinical studies were bronchitis, cold symptoms, middle ear infections, headache, lightheadedness or dizziness, asthma, and nosebleeds. The following adverse reactions have been identified during post-approval use of the SINUVA sinus implant. These events include implant migration, lack of efficacy, nasal pain, headache, and nosebleeds.

Tell your doctor if you have any side effects that bother you or don't go away.

Risks related with the insertion and removal of SINUVA are similar to other endoscopic sinus procedures.

SINUVA is made from materials designed to soften over time and may fall out of the nose on its own as polyps decrease or if you sneeze or blow your nose forcefully. The implant will be removed 90 days after placement or earlier at your doctor's discretion.

**Contact your doctor immediately** if you have any changes in vision, excessive nasal bleeding, symptoms of infection or symptoms suggesting that the implant has moved, such as irritation or a choking sensation in the back of the throat.

**You are encouraged to report negative side effects of prescription drugs to the FDA. Visit [www.fda.gov/medwatch](http://www.fda.gov/medwatch), or call 1-800-FDA-1088.**

**For important risk and use information, please see accompanying Full Prescribing Information for SINUVA or at [SINUVA.com/PI](http://SINUVA.com/PI)**

## HIGHLIGHTS OF PRESCRIBING INFORMATION

These highlights do not include all the information needed to use SINUVA® safely and effectively. See full prescribing information for SINUVA.

**SINUVA (mometasone furoate) sinus implant**  
**Initial U.S. Approval: 1987**

### INDICATIONS AND USAGE

SINUVA Sinus Implant is a corticosteroid-eluting (mometasone furoate) implant indicated for the treatment of nasal polyps in patients ≥ 18 years of age who have had ethmoid sinus surgery. (1)

### DOSAGE AND ADMINISTRATION

- The SINUVA Sinus Implant is loaded into a Delivery System and placed in the ethmoid sinus under endoscopic visualization. The Implant may be left in the sinus to gradually release the corticosteroid over 90 days. Remove the implant by 90 days or earlier at the physician's discretion using standard surgical instruments.. (2.2)
- To be inserted by physicians trained in otolaryngology. (2.3)

### DOSAGE FORM AND STRENGTH

One SINUVA Sinus Implant system contains 1350 mcg of mometasone furoate and a sterile Delivery System. (3)

### CONTRAINDICATIONS

- Patients with known hypersensitivity to mometasone furoate and any of the ingredients of the SINUVA Sinus Implant. (4)

## WARNINGS AND PRECAUTIONS

- Monitor nasal mucosa adjacent to the SINUVA Sinus Implant for any signs of bleeding (epistaxis), irritation, infection, or perforation. Avoid use in patients with nasal ulcers or trauma. (5.1)
- Monitor patients with a change in vision or with a history of increased intraocular pressure, glaucoma, and/or cataracts closely. (5.2)
- Hypersensitivity reactions, including rash, pruritus, and angioedema, have been reported with use of corticosteroids. (5.3)
- Potential worsening of existing tuberculosis; fungal, bacterial, viral, or parasitic infection; or ocular herpes simplex. More serious or even fatal course of chickenpox or measles in susceptible patients. Use caution in patients with the above because of the potential for worsening of these infections. (5.4)
- If corticosteroid effects such as hypercorticism and adrenal suppression appear in patients, consider sinus implant removal. (5.5)

## ADVERSE REACTIONS

The most common adverse reactions (in more than 1% of subjects) were bronchitis, nasopharyngitis, otitis media, headache, presyncope, asthma, and epistaxis. (6)

To report SUSPECTED ADVERSE REACTIONS, contact Intersect ENT at 1-866 531-6004 or FDA at 1-800-FDA-1088 or [www.fda.gov/medwatch](http://www.fda.gov/medwatch)

## **FULL PRESCRIBING INFORMATION**

### **1 INDICATIONS AND USAGE**

SINUVA Sinus Implant is a corticosteroid-eluting (mometasone furoate) implant indicated for the treatment of nasal polyps in patients  $\geq 18$  years of age who have had ethmoid sinus surgery.

### **2 DOSAGE AND ADMINISTRATION**

#### **2.1 Dosing**

One SINUVA Sinus Implant containing 1350 mcg of mometasone furoate.

#### **2.2 General Instructions**

The SINUVA Sinus Implant (Figure 1) is loaded into a Delivery System and placed in the ethmoid sinus under endoscopic visualization. The SINUVA Sinus Implant is made from bioabsorbable polymers designed to gradually soften over time. The SINUVA Sinus Implant may be left in the sinus to gradually release the corticosteroid over 90 days. Remove the SINUVA Sinus Implant by 90 days or earlier at the physician's discretion using standard surgical instruments.

#### **2.3 Health Care Provider Training**

The SINUVA Sinus Implant is to be used by physicians trained in otolaryngology. Specialized training is not required for these physicians.

#### **2.4 Placement of SINUVA Sinus Implant**

The SINUVA Sinus Implant is designed for single patient use only. Do not reprocess or reuse.

- Do not use if the package is open, the package or product is damaged, or has evidence of gross contamination.
- Special care should be taken to avoid bending, twisting, or damaging the implant.
- The implant is not designed to be modified by the physician.
- The implant is not intended to be compressed and loaded into the Delivery System more than two times. The implant must be placed under endoscopic visualization.

### Patient Preparation

The patient should be prepared following routine protocols for in-office sinonasal endoscopic procedures.

### Implant Preparation

Remove the Crimper (Figure 2) and the Delivery System (Figure 3) from their protective packaging using sterile technique. Inspect the SINUVA Sinus Implant located inside of the Crimper (Figure 2). Do not remove the Implant from the Crimper. Prior to use, the SINUVA Sinus Implant must be crimped and loaded into the Delivery System.

If the SINUVA Sinus Implant is not fully seated inside of the Crimper, secure the SINUVA Sinus Implant before proceeding. See instructions to secure the SINUVA Sinus Implant (Figure 12–15).

<b>IMPLANT</b>	Length (nominal):	20 mm
	Expanded Diameter (nominal):	34 mm
<b>DELIVERY SYSTEM</b>	Shaft Length	117 mm

**Figure 1: Implant**

**Figure 2: Crimper with Implant**

**Figure 3: Delivery System**

1. Place the Crimper on a flat surface and hold to prevent any potential slipping of the Crimper during loading of the SINUVA Sinus Implant into the Delivery System. Orient the Crimper such that the short ends of the Implant are in the 12 o'clock and 6 o'clock position (Figure 4)

**Figure 4**

2. Grasp the Delivery System with the index and middle fingers on the left or right hand using the Finger Rests and the thumb in the Thumb Rest (Figure 5).

**Figure 5**

3. Pull back on the Finger Rests while pressing down on the Thumb Rest to retract the Cup and expose the Seeker (Figure 6).

**Figure 6**

4. Position the tip of the Seeker with its 10° angled tip downwards toward the user in the depression in the center of the SINUVA Sinus Implant (Figure 7). The distal end of the angled shaft must be in a vertical position, perpendicular to the Crimper, during positioning. Ensure the plane of the angled tip is in the same plane as the short ends of the Implant that were oriented in the 12 o'clock / 6 o'clock position in step 1.

**Figure 7**

5. With the Thumb Rest depressed, gradually apply perpendicular downward force to the SINUVA Sinus Implant until the ends of the Implant collapse around the Seeker of Delivery System (Figure 8). Make sure that the Finger Rests are not released while pushing downwards.

**Figure 8**

6. The SINUVA Sinus Implant should crimp in a radial fashion onto the Seeker. Implant ends should not cross over or past each other when being crimped onto the Seeker by the Crimper.
7. While maintaining steady downward pressure on the Thumb Rest, slowly release the Finger Rests with the index and middle fingers until the Cup lowers and captures all ends of the SINUVA Sinus Implant (Figure 9). If necessary, adjust the position of the Delivery System with slight circular movements, slightly lifting and then lowering the Cup into position to ensure that all eight ends of the SINUVA Sinus Implant are secured within the Cup.

**Figure 9**

8. Apply a downward push on the Delivery System to ensure that the SINUVA Sinus Implant is secured in the Cup (Figure 10). This will also ensure the Implant is compressed to its smallest profile for insertion.

**Figure 10**

9. Retract the Delivery System from the Crimper. The SINUVA Sinus Implant should remain symmetrically loaded in the Cup of the Delivery System (Figure 11).

**Figure 11**

**CAUTION: Do not leave the SINUVA Sinus Implant in the crimped state for more than 5 minutes prior to placement.**

**Instructions to Secure the SINUVA Sinus Implant in the Crimper**

If necessary, the Implant may be reloaded into the Crimper for a second time.

**CAUTION: The SINUVA Sinus Implant should not be used if the second attempt to crimp is unsuccessful.**

1. Hold the SINUVA Sinus Implant by one end as shown in Figure 12.

**Figure 12**

2. Holding the SINUVA Sinus Implant with the dome-shaped Cap positioned downward (Figure 13), place the Implant back into the Crimper.

**Figure 13**

3. Ensure that each Implant is secured in the Crimper by pressing down on the center of the Implant until all ends of the Implant are below the rim of the Crimper (Figure 14).

**Figure 14**

4. Inspect the Implant and the Crimper to ensure that all the Implant ends are secured below the rim of the Crimper (Figure 15). Return to Implant Preparation Step 1 for instructions on how to load the re-secured implant into the delivery system.

**Figure 15**

### **Instructions for the SINUVA Sinus Implant Placement**

Advance the Delivery System under endoscopic visualization into the ethmoid sinus cavity.

1. Ensure that the Delivery System is oriented such that the 10° curvature of the distal tip is curved superiorly. Insert the Delivery System such that the Shaft is parallel to roof of ethmoid sinus.
2. If the SINUVA Sinus Implant becomes dislodged from the Delivery System prior to placement into the ethmoid sinus, remove the Implant and inspect for damage, re-load the undamaged Implant in the Crimper, and re-crimp the Implant into the Delivery System. Note that the SINUVA Sinus Implant should not be loaded into the Delivery System more than twice.
3. Release the SINUVA Sinus Implant by pressing down on the Thumb Rest while pulling back on the Finger Rests in a controlled manner.
4. Place the SINUVA Sinus Implant amongst the sinus polyps with the cap oriented toward the posterior ethmoid sinus, and with the Implant positioned as superiorly as possible in the sinus. The long ends of the Implant should be in approximately the 2 o'clock, 4 o'clock, 8 o'clock and 10 o'clock positions, respectively. Confirm final placement of the SINUVA Sinus Implant by endoscopic visualization. To adjust the position of the SINUVA Sinus Implant, use the Seeker on the Delivery System or standard endoscopic surgical instruments.

#### **Post Placement Instructions**

Reposition the Implant if its ends are perpendicular to and in contact with the nasal septum. Avoid excessive manipulation of the Implant during follow-up, as this can cause dislodgement.

### **2.5 Removal Instructions**

The SINUVA Sinus Implant is made from bioabsorbable polymers designed to gradually soften over time. The Implant may be left in the sinus to gradually release the corticosteroid over 90 days. Remove the SINUVA Sinus Implant by day 90 or earlier at the physician's discretion using standard endoscopic instruments.

## **3 DOSAGE FORM AND STRENGTH**

Each SINUVA Sinus Implant is a sterile, single-use, bioabsorbable implant, coated with a formulation containing 1350 mcg mometasone furoate that is gradually released over 90 days.

## **4 CONTRAINDICATIONS**

Patients with known hypersensitivity to mometasone furoate, or to any of the copolymers of the SINUVA Sinus Implant [*see Description (11)*].

## **5 WARNINGS AND PRECAUTIONS**

### **5.1 Local Effects**

Monitor nasal mucosa adjacent to the SINUVA Sinus Implant for any signs of bleeding (epistaxis), irritation, infection, or perforation. Avoid use in patients with nasal ulcers or trauma.

## 5.2 Ocular Effects

Glaucoma, cataracts, and clinically significant elevation of intraocular pressure were not observed in patients from the treatment group of one randomized controlled clinical study (N = 53) who underwent bilateral placement of SINUVA Sinus Implants. Close monitoring is warranted in patients with a change in vision or with a history of increased intraocular pressure, glaucoma, and/or cataracts.

## 5.3 Hypersensitivity Reactions

Hypersensitivity reactions, including rash, pruritus, and angioedema have been reported with use of corticosteroids.

## 5.4 Immunosuppression

Persons who are using drugs that suppress the immune system are more susceptible to infections than healthy individuals. Chickenpox and measles, for example, can have a more serious or even fatal course in susceptible children or adults using corticosteroids. In such children or adults who have not had these diseases or who are not properly immunized, particular care should be taken to avoid exposure. How the dose, route, and duration of corticosteroid administration affect the risk of developing a disseminated infection is not known.

The contribution of the underlying disease and/or prior corticosteroid treatment to the risk is also not known. If exposed to chickenpox, prophylaxis with varicella zoster immune globulin (VZIG) may be indicated. If exposed to measles, prophylaxis with pooled intramuscular immunoglobulin (IG) may be indicated (See the respective package inserts for complete VZIG and IG prescribing information). If chickenpox develops, treatment with antiviral agents may be considered. Corticosteroids should be used with caution, if at all, in patients with active or quiescent tuberculosis infection of the respiratory tract; untreated systemic fungal, bacterial, viral, or parasitic infections; or ocular herpes simplex.

## 5.5 Hypercorticism and Adrenal Suppression

Hypercorticism and adrenal suppression were not evaluated as part of the SINUVA Sinus Implant clinical program.

Since individual sensitivity to effects of cortisol production exists, physicians should consider this information when prescribing SINUVA Sinus Implant. Particular care should be taken in observing patients postoperatively or during periods of stress for evidence of inadequate adrenal response.

It is possible that systemic corticosteroid effects such as hypercorticism and adrenal suppression may appear in patients, particularly when systemic mometasone furoate is administered at higher than recommended doses over prolonged periods of time. If such effects occur, consider sinus implant removal.

## 6 ADVERSE REACTIONS

The following adverse reactions are discussed in more detail in other sections of the labeling:

- Local effects including epistaxis, irritation, infection, or perforation [*see Warnings and Precautions (5.1)*]
- Cataracts and glaucoma [*see Warnings and Precautions (5.2)*]

- Hypersensitivity Reactions [*see Warnings and Precautions (5.3)*]
- Immunosuppression [*see Warnings and Precautions (5.4)*]
- Hypothalamic-pituitary-adrenal (HPA) axis effects [*see Warnings and Precautions (5.5)*]

### 6.1 Clinical Trials Experience

Because clinical trials are conducted under widely varying conditions, adverse reaction rates observed in the clinical trials of a drug cannot be directly compared to rates in the clinical trials of another drug and may not reflect the rates observed in practice.

The safety of the SINUVA Sinus Implant was evaluated and demonstrated in 400 patients in 2 controlled, randomized, parallel group, single-blind studies. In Study 1, one-hundred (100) subjects were followed for 6 months. In Study 2, three-hundred (300) subjects were followed for 90 days. Of the 400 patients, 254 were assigned to the treatment group and underwent bilateral placement of SINUVA Sinus Implants in the ethmoid sinuses, totaling 2700 mcg of mometasone furoate, and 146 patients were assigned to the control group and underwent a sham procedure consisting of advancement of the Delivery System with the SINUVA Sinus Implant followed by removal without deployment. The Implants were removed by Day 60. All patients were required to use mometasone furoate nasal spray once daily (200 mcg of mometasone furoate) through Day 90.

Table 1 shows the common adverse reactions (in greater than 1% of subjects) that occurred more frequently in patients treated with SINUVA Sinus Implant compared to the control group.

**Table 1: Adverse Reactions with > 1% Incidence and More Common than Control in 90-Day Controlled Clinical Trials with SINUVA Sinus Implant**

Adverse Reaction	Study 1 & Study 2 Combined Data	
	Treatment <sup>a</sup> (N = 254) n (%)	Control <sup>b</sup> (N = 146) n (%)
Asthma	12 (4.7)	6 (4.1)
Headache	9 (3.5)	5 (3.4)
Epistaxis	6 (2.4)	2 (1.4)
Presyncope	6 (2.4)	3 (2.1)
Bronchitis	5 (2.0)	2 (1.4)
Otitis media	5 (2.0)	2 (1.4)
Nasopharyngitis	3 (1.2)	1 (0.7)

Values represent patient counts and percentages. A patient reporting more than one adverse event for a particular MedDRA preferred term is counted only once.

<sup>a</sup> Patients in the treatment group received SINUVA Sinus Implants placed bilaterally in the ethmoid sinuses and used mometasone furoate nasal spray once daily (200 mcg mometasone furoate) through Day 90.

<sup>b</sup> Patients in the control group underwent a sham procedure and used mometasone furoate nasal spray once daily (200 mcg mometasone furoate) through Day 90.

Study 1 monitored patients from Day 90 through 6 months. Hypersensitivity (4% (n=2) vs. 0), chronic sinusitis (11% (n=6) vs. 9% (n=4)), and upper respiratory tract infections (8% (n=4) vs. 2% (n=1)) were reported in more than 2 subjects in the treatment group, and more commonly than the control group during this time period.

The safety of repeat administration of the SINUVA Sinus Implant was evaluated in Study 3 that was an open-label, single-arm, multicenter study in 50 patients. All patients underwent an in-office bilateral placement of the SINUVA Sinus Implant in each ethmoid sinus (totaling 2

implants) and were followed for 365 days. Patients were required to use mometasone furoate nasal spray once daily (200 mcg of mometasone furoate) through 365 days. At 90 days, the remaining implants were removed. To maximize the size of the safety population, patients with ethmoid sinus polyps grade  $\geq 1$  on any side were considered for repeat implant placement. Repeat placement was not performed if polyp grade was  $< 1$ , or if the patient declined it. Of the 50 patients, 41 received repeat implant placement (33 bilaterally and 8 unilaterally). Acute sinusitis (29%, n=12), upper respiratory infection (17%, n=7) epistaxis (12%, n=5), nasal discomfort or rhinalgia (12%, n=5), headache (7%, n=3), were the common adverse reactions that occurred in at least 3 subjects who underwent repeat placement during the study period.

## **6.2 Post-Marketing Experience**

The following adverse reactions have been identified during postapproval use of the SINUVA sinus implant. These events have been chosen for inclusion due to either their seriousness, frequency of reporting, possible causal connection to SINUVA, or a combination of these factors, include: implant migration, lack of efficacy, nasal pain, headache, epistaxis. Because these reactions are reported voluntarily from a population of uncertain size, it is not always possible to reliably estimate their frequency or establish a causal relationship to drug experience.

## **7 DRUG INTERACTIONS**

Formal drug-drug interaction studies have not been conducted with the SINUVA Sinus Implant. An evaluation of the concurrent administration of the SINUVA Sinus Implant and other commonly used nasal drugs was not associated with any unusual adverse reactions.

### **7.1 Inhibitors of Cytochrome P450 3A4**

Co-administration with ketoconazole, a potent CYP 3A4 inhibitor, may increase the plasma concentrations of mometasone furoate [*see Clinical Pharmacology (12.3)*].

## **8 USE IN SPECIFIC POPULATIONS**

### **8.1 Pregnancy**

#### Risk Summary

There are no randomized clinical studies of SINUVA Sinus Implant or mometasone furoate in pregnant women. The active pharmaceutical ingredient, mometasone furoate is systemically available when administered topically or when inhaled. In animal reproduction studies, subcutaneous administration of mometasone furoate to pregnant mice, rats, or rabbits caused increased fetal malformations and decreased fetal survival and growth following administration of doses that produced exposures approximately 1/3 to 8 times the maximum recommended human dose (MRHD) on a mcg/m<sup>2</sup> or AUC basis [*see Data*]. However, experience with oral corticosteroids suggests that rodents are more prone to teratogenic effects from corticosteroid exposure than humans.

The estimated background risk of major birth defects and miscarriage for the indicated population is unknown. In the U.S. general population, the estimated risk of major birth defects and miscarriage in clinically recognized pregnancies is 2 to 4% and 15 to 20%, respectively.

#### Data

##### *Animal Data*

In an embryofetal development study with pregnant mice dosed throughout the period of organogenesis, mometasone furoate produced cleft palate at an exposure approximately one-third of the MRHD (on a mcg/m<sup>2</sup> basis with maternal subcutaneous doses of 60 mcg/kg and above) and decreased fetal survival at an exposure approximately equivalent to the MRHD (on a mcg/m<sup>2</sup> basis with a maternal subcutaneous dose of 180 mcg/kg). No toxicity was observed with a dose that produced an exposure approximately one-tenth of the MRHD (on a mcg/m<sup>2</sup> basis with maternal topical dermal doses of 20 mcg/kg and above).

In an embryofetal development study with pregnant rats dosed throughout the period of organogenesis, mometasone furoate produced fetal umbilical hernia at exposures approximately 6 times the MRHD (on a mcg/m<sup>2</sup> basis with maternal topical dermal doses of 600 mcg/kg and above) and delays in fetal ossification at exposures approximately 3 times the MRHD (on a mcg/m<sup>2</sup> basis with maternal topical dermal doses of 300 mcg/kg and above).

In another reproductive toxicity study, pregnant rats were dosed with mometasone furoate throughout pregnancy or late in gestation. Treated animals had prolonged and difficult labor, fewer live births, lower birth weight, and reduced early pup survival at an exposure that was approximately 8 times the MRHD (on an area under the curve (AUC) basis with a maternal subcutaneous dose of 15 mcg/kg). There were no findings with an exposure approximately 4 times the MRHD (on an AUC basis with a maternal subcutaneous dose of 7.5 mcg/kg).

Embryofetal development studies were conducted with pregnant rabbits dosed with mometasone furoate by either the topical dermal route or oral route throughout the period of organogenesis. In the study using the topical dermal route, mometasone furoate caused multiple malformations in fetuses (e.g., flexed front paws, gallbladder agenesis, umbilical hernia, hydrocephaly) at an exposure approximately 3 times the MRHD (on a mcg/m<sup>2</sup> basis with maternal topical dermal doses of 150 mcg/kg and above). In the study using the oral route, mometasone furoate caused increased fetal resorptions and cleft palate and/or head malformations (hydrocephaly and domed head) at an exposure approximately 1/2 of the MRHD (on AUC basis with a maternal oral dose of 700 mcg/kg). At an exposure approximately 2 times the MRHD (on an AUC basis with a maternal oral dose of 2800 mcg/kg), most litters were aborted or resorbed. No effects were observed at an exposure approximately 1/10 of the MRHD (on an AUC basis with a maternal oral dose of 140 mcg/kg).

## **8.2 Lactation**

### **Risk Summary**

There are no available data on the presence of SINUVA Sinus Implant in human milk, the effects on the breastfed child or the effects on milk production. Systemic absorption of a single inhaled 400 mcg mometasone dose was less than 1%. It is not known if mometasone furoate is excreted in human milk. Other inhaled corticosteroids, similar to mometasone furoate, are present in human milk. The developmental and health benefits of breastfeeding should be considered along with the mother's clinical need for the SINUVA Sinus Implant and any potential adverse effects on the breastfed infant from the SINUVA Sinus Implant.

## **8.4 Pediatric Use**

The safety and effectiveness of the SINUVA Sinus Implant have not been established in children or adolescents less than 18 years of age.

### 8.5 Geriatric Use

A total of 33 patients 65 years of age or older received the SINUVA Sinus Implant in 2 controlled randomized clinical trials. Clinical studies did not include sufficient numbers of subjects aged 65 and over to determine whether they respond differently from younger subjects.

### 8.6 Hepatic Impairment

Concentrations of mometasone furoate appear to increase with severity of hepatic impairment [see *Clinical Pharmacology* (12.3)].

## 10 OVERDOSAGE

There are no data available on the effects of acute or chronic overdosage with SINUVA Sinus Implant. Chronic overdosage may result in signs/symptoms of hypercorticism [see *Warnings and Precautions* (5.5)].

Because the SINUVA Sinus Implant is designed for placement in the ethmoid sinus by a physician under endoscopic visualization, overdose is unlikely to occur. Low systemic bioavailability and an absence of acute drug-related systemic findings in clinical studies, indicate that acute overdose is unlikely to require any treatment other than observation. Single inhalation daily doses of a mometasone furoate dry powder inhalation formulation as high as 1200 mcg per day for 28 days were well tolerated and did not cause a significant reduction in plasma cortisol AUC (94% of placebo AUC). Single oral doses up to 8000 mcg have been studied on human volunteers with no adverse reactions reported.

## 11 DESCRIPTION

The SINUVA Sinus Implant is a self-expanding, bioabsorbable, drug eluting implant provided with a crimper and a single-use delivery system. SINUVA Sinus Implant is comprised of poly(L-lactide-co-glycolide) and poly(L-lactide-co-ε-caprolactone) coated with mometasone furoate embedded in a bioabsorbable polymer matrix containing poly(DL-lactide-co-glycolide) and polyethylene glycol (inactive ingredients) which provides for gradual release of the drug. The SINUVA Sinus Implant is packaged in a tray, which is then sealed in a foil pouch and placed in the product carton. The SINUVA Sinus Implant is provided sterile.

Mometasone furoate, the active component of the SINUVA Sinus Implant, is a corticosteroid with the chemical name 9,21-dichloro-11(β),17-dihydroxy-16(α)-methylpregna-1,4-diene-3,20-dione 17 (2-furoate). Mometasone furoate is a white powder with an empirical formula of C<sub>27</sub>H<sub>30</sub>Cl<sub>2</sub>O<sub>6</sub>, and molecular weight of 521.44 Daltons.

The chemical structure of mometasone furoate is shown below:

The inactive ingredients are poly-(DL-lactide-co-glycolide) and polyethylene glycol. Poly-(DL-lactide-co-glycolide) is an amorphous biodegradable polymer.

## 12 CLINICAL PHARMACOLOGY

### 12.1 Mechanism of Action

Mometasone furoate is a corticosteroid demonstrating potent anti-inflammatory activity. The precise mechanism of corticosteroid action on inflammation is not known. Corticosteroids have been shown to have a wide range of effects on multiple cell types (e.g., mast cells, eosinophils, neutrophils, macrophages, and lymphocytes) and mediators (e.g., histamine, eicosanoids, leukotrienes, and cytokines) involved in inflammation.

### 12.2 Pharmacodynamics

#### Adrenal Function:

The effects of the SINUVA Sinus Implant on adrenal function have not been evaluated in clinical studies.

### 12.3 Pharmacokinetics

One pharmacokinetics study was conducted with the SINUVA Sinus Implant. The remaining information is from other products containing mometasone furoate.

#### Absorption:

A pharmacokinetics study was conducted to evaluate the potential for systemic exposure to mometasone furoate from the sinonasal route of administration following bilateral placement of the SINUVA Sinus Implant. Baseline blood samples were taken before the procedure, and on Days 3, 7, 14, 21 and 30 to assess systemic concentrations of mometasone furoate in plasma. Six out of fifteen PK samples from five subjects had measurable mometasone furoate plasma concentrations from Day 3 to Day 14. All the measurable concentrations were within 2.5-fold of the lower limit of quantitation (LLOQ; 30 pg/mL). No PK samples had measurable mometasone furoate plasma concentrations after Day 14.

#### Distribution:

Following an intravenous 400 mcg dose of mometasone furoate, the mean steady state volume of distribution was 152 L. The *in vitro* protein binding for mometasone furoate was reported to be 98% to 99% (in concentration range of 5 to 500 ng/mL).

#### Metabolism:

Studies have shown that mometasone furoate is primarily and extensively metabolized in the liver of all species investigated and undergoes extensive metabolism to multiple metabolites. *In vitro* studies have confirmed the primary role of CYP 3A4 in the metabolism of this compound; however, no major metabolites were identified.

#### Excretion:

Following intravenous dosing, the terminal half-life was reported to be about 5 hours.

#### Special Populations:

The effects of renal impairment, hepatic impairment, age, or gender on mometasone furoate pharmacokinetics have not been adequately investigated.

#### Drug-drug Interaction:

Formal drug-drug interaction studies have not been conducted with the SINUVA Sinus Implant.

## 13 NONCLINICAL TOXICOLOGY

### 13.1 Carcinogenesis, Mutagenesis, Impairment of Fertility

In a 2-year carcinogenicity study in Sprague Dawley rats, mometasone furoate demonstrated no statistically significant increase of tumors at inhalation doses up to 67 mcg/kg (approximately 14 times the MRHD on an AUC basis). In a 19-month carcinogenicity study in Swiss CD-1 mice, mometasone furoate demonstrated no statistically significant increase in the incidence of tumors at inhalation doses up to 160 mcg/kg (approximately 9 times the MRHD on an AUC basis).

Mometasone furoate increased chromosomal aberrations in an in vitro Chinese hamster ovary cell assay, but did not have this effect in an in vitro Chinese hamster lung cell assay.

Mometasone furoate was not mutagenic in the Ames test or mouse lymphoma assay, and was not clastogenic in an in vivo mouse micronucleus assay, a rat bone marrow chromosomal aberration assay, or a mouse male germ-cell chromosomal aberration assay. Mometasone furoate also did not induce unscheduled DNA synthesis in vivo in rat hepatocytes.

In reproductive studies in rats, impairment of fertility was not produced by subcutaneous doses up to 15 mcg/kg (approximately 8 times the MRHD on an AUC basis).

## 14 CLINICAL STUDIES

The SINUVA Sinus Implant was evaluated in 450 patients, 18 years of age and older, with nasal polyps and a history of ethmoid sinus surgery. The development program included a trial of 6 months duration (Study 1: NCT01732536), another trial of 90 days duration (Study 2: NCT02291549), and a repeat placement study of 1-year duration (Study 3: NCT03358329) [*see Adverse Reactions (6.1)*]. The efficacy of SINUVA Sinus Implant is based primarily on Study 2 as described below.

Study 2 was a randomized, controlled, single-blind, multicenter (all sites were in the US) study with 300 patients: 201 patients were assigned to the treatment group and underwent bilateral placement of the SINUVA Sinus Implants in the ethmoid sinuses. The remaining 99 patients were assigned to the control group and underwent a placebo (sham) procedure, consisting of advancement of the Delivery System with the SINUVA Sinus Implant into the ethmoid sinuses, followed by removal of the Delivery System without deployment of the SINUVA Sinus Implant. The Implants were removed by Day 60 to allow blinded grading at Day 90. All patients [treatment (T) and control (C) groups] were required to use a mometasone furoate nasal spray once daily (200 mcg of mometasone furoate) through Day 90.

The co-primary efficacy endpoints were:

- Change from baseline to Day 30 in Nasal Obstruction/Congestion score, as determined by patients using a daily diary; and
- Change from baseline to Day 90 in bilateral polyp grade, as determined from video-endoscopies reviewed by an independent panel of 3 sinus surgeons who were masked to treatment assignment.

The study population consisted of adult patients ( $\geq 18$  years of age) diagnosed with chronic sinusitis who had undergone prior bilateral total ethmoidectomy but were indicated for revision endoscopic sinus surgery because they presented with recurrent nasal obstruction/congestion symptoms and recurrent bilateral sinus obstruction due to sinonasal polyposis. Subjects were excluded for other grade 3 or 4 adhesions/synechiae, grade 4 polyposis, acute bacterial or invasive fungal sinusitis, and immune deficiency, including cystic fibrosis. There were no statistically significant differences between groups in baseline demographics and clinical characteristics, except the treatment group had a higher proportion of asthma patients (T: 74% vs. C: 62%) and higher mean Percent Ethmoid Sinus Obstruction score [T: 76 (SD 17.4) vs. C: 69 (SD 19.9)]. The random imbalances did not impact treatment effect.

The co-primary efficacy results are presented in Table 2. The treatment group demonstrated a statistically significant difference from baseline to Day 30 in Nasal Obstruction/Congestion score and from baseline to Day 90 in bilateral polyp grade, compared to the control group.

**Table 2: Co-Primary Efficacy Results with the SINUVA Sinus Implant (Study 2)**

	<b>Treatment (N = 201)</b>	<b>Control (N = 99)</b>
<b>Nasal Obstruction/Congestion Score<sup>a</sup></b>		
N	201	99
Baseline, Mean (SD)	2.36 (0.49)	2.35 (0.48)
Change from Baseline, Mean (SD)	-0.80 (0.73)	-0.56 (0.62)
Difference vs. Control (95% CI) <sup>b</sup>	-0.23 (-0.39, -0.06)	
<b>Bilateral Polyp Grade<sup>c</sup></b>		
N	195	97
Baseline, Mean (SD)	5.48 (1.13)	5.43 (1.01)
Change from Baseline, Mean (SD)	-0.56 (1.06)	-0.15 (0.91)
Difference vs. Control (95% CI) <sup>b</sup>	-0.35 (-0.60, -0.09)	

- a) Change from baseline in Nasal Obstruction/Congestion was assessed on a scale of 0–3 where 0=no symptoms, 1=mild symptoms, 2=moderate symptoms, and 3=severe symptoms. Scores were assessed using a daily diary for 7 days immediately preceding the baseline and Day 30 visits.
- b) Based on analysis of covariance (ANCOVA) model with baseline value as a covariate and site and treatment group as fixed effects.
- c) Change from baseline to Day 90 in bilateral polyp grade was assessed based on grading of video-endoscopies by an independent panel of 3 sinus surgeons who were blinded to treatment assignment. Polyps were graded as follows: 0=no visible polyps, 1=Small amount of sinonasal polyps confined in middle meatus, 1.5= 1+ polypoid edema obstructing  $\geq 25\%$  of the ethmoid sinus cavity, 2=Expanded amount of sinonasal polyps confined in middle meatus, 2.5 = 2 + polypoid edema obstructing  $\geq 50\%$  of the ethmoid sinus cavity, 3=Sinonasal polyps extending beyond middle meatus, but not totally obstructing the nasal cavity, 3.5= 3 + polypoid edema obstructing  $\geq 75\%$  of the ethmoid sinus cavity, 4=Sinonasal polyps completely obstructing the nasal cavity.

Change from baseline to Day 90 in the mean Percent Ethmoid Sinus Obstruction score (100 mm VAS), as judged by the independent panel [Difference vs. control: -7.96%; 95% CI (-12.1, -3.8)], met statistical significance and supported the co-primary endpoints.

## 16 HOW SUPPLIED/STORAGE AND HANDLING

One SINUVA Sinus Implant kit consists of an individual Implant inside of a Crimper and one disposable Delivery System packaged in a foil pouch. The SINUVA Sinus Implant is 20 mm in length and 34 mm in expanded diameter (Figure 1) and contains 1350 mcg of mometasone furoate.

Store the SINUVA Sinus Implant at 20–25°C (68–77°F); excursions permitted at 15–30°C (59–86°F) [*see USP Controlled Room Temperature*].

The NDC code for the SINUVA Sinus Implant is 10599-003-01.

## 17 PATIENT COUNSELING INFORMATION

- Encourage patients to use saline irrigations or sprays regularly.
- Advise the patient that the Implant is bioabsorbable and intended to soften over time. As the Implant softens and polyps decrease, the Implant may be expelled out of the nose on its own or with actions such as sneezing or forceful nose blowing.
- Advise the patient to call a health care professional immediately if they experience any of the following:
  - Excessive nasal bleeding or symptoms of infection, such as excessive pain or discomfort, persistent headache, increased sinus discharge.
  - Symptoms suggesting the Implant has migrated posteriorly, such as irritation or choking sensation in the back of the throat or swallowing the Implant.

### 17.1 Risks Relating to the Insertion and Removal Procedure

Inform patients that there are risks associated with the insertion and removal of the SINUVA Sinus Implant. These risks are similar to those associated with other endoscopic sinus procedures.

### 17.2 Local Effects

Patients should be informed that treatment with the SINUVA Sinus Implant may be associated with local adverse reactions such as nose bleed (epistaxis), injury to nerves or blood vessels of the middle turbinate or septum, bacterial or candida infection. Because of the potential inhibitory effect of corticosteroids on wound healing, patients who have experienced recent nasal septum ulcers, nasal surgery, or nasal trauma should not use a nasal corticosteroid until healing has occurred [*see Warnings and Precautions (5.1) and Adverse Reactions (6)*].

### 17.3 Hypersensitivity Reactions

Hypersensitivity reactions, including rash, pruritus, and angioedema, have been reported with use of mometasone furoate. Remove the SINUVA Sinus Implant if such reactions occur [*see Contraindications (4), Warnings and Precautions (5.3), and Adverse Reactions (6)*].

### 17.4 Immunosuppression

Patients who are on immunosuppressant doses of corticosteroids should be warned to avoid exposure to chickenpox or measles and, if exposed, to consult their physician without delay. Patients should be informed of potential worsening of existing tuberculosis; fungal, bacterial, viral, or parasitic infections; or ocular herpes simplex [*see Warnings and Precautions (5.4)*].
